

ENABLING DATA OUTPUT

The PMDG 737NGX is already set up to listen for control events that may originate from an external application. However, since providing state data to third party applications does consume a small amount of processor attention, **we have disabled this communication output by default** since the vast majority of our users will not be using SDK driven applications.

To enable the data communication output, you will need to open the file **737NGX_Options.ini** that is located in the folder <FSX ROOT>\PMDG\PMDG 737 NGX

Once this folder is open, add the following two lines to the bottom of the file:

```
[SDK]
EnableDataBroadcast=1
```

When you release your product to customers, it will be necessary for your application installation to set this parameter on the customer's installation, else they will not see data connectivity between your application and the PMDG 737NGX.
